ROUND0

Another R-16-S sold

We are proud to announce that we have secured another order for the R-16-S, the **world's largest section bending machine**. The previous R-16-S was delivered to Barnshaw Section Bending Co. in the UK, and this time the machine will go to Greiner Industries in the U.S. The R-16-S has capacity to bend beams up to 1100 mm (44") the hard way, which previously was only possible to roll in our giant Beam Bending Machine type B-15000-S (see separate news article about an order for this machine).

Our model R-15-S, formerly the largest section bending machine in the world, could bend hard-way beams up to 800 mm (32"), but with the R-16-S we now have machines that cover virtually all beam sizes available on the market.

The R-16-S strengthens our position as the dominant supplier of these large section bending machines. Other manufacturers of section bending machines have never designed, built or delivered machines in the larger segment.

Our reference list of machines supplied to satisfied customers all over the world is long and keeps growing all the time! Over the last few months, we have received orders for several large section bending machines, including an R-13-S to Spain and another R-13-S to Indonesia.

Other manufacturers have tried to convince customers to buy imaginary machines in sizes they have never built. In some cases for "smaller" section bending machines, like R-9-S and R-11-S, they have actually managed to get an order, but when the machine is eventually delivered, it does not live up to the customer's expectations or to the promises made. This is a well-known fact for larger bending companies around the world, where ROUND0 is the natural and preferred choice. For smaller companies with little or no experience in bending, the promises made by our competitors can lead to disaster, since they will end up with machines not capable of doing good work, resulting in a costly experience.
